ENAMEL

## Metal enamel magnets

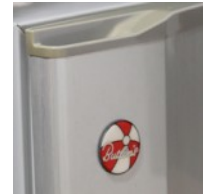

Metal enamel magnets are made in any type of quality, shape and size. There are many different type of magnet parts like, **rubberized magnet, ceramic magnet and strong metal magnet** (also called neodymium magnet).

Rubberized magnet is the cheapest version but also the weakest version.

We usually take a 3 pages test, meaning the magnet is supposed to hold 3 pages thick of paper. It is difficult in china to find that quality

Except in the case of offset where the item usually thin and light, it is not recommended to use rubberized magnet for metal enamel item as the metal part will too heavy and put to much strain of the magnet.
