## Metal enamel cufflink

Cufflink attachment comes in a few different standard models and shape.

To guarantee good quality, durable and long last time cufflink, it is important to note that **the cufflink should be made of brass stamping**, either soft or hard enamel. To be of good quality the cufflink attachment needs to be welded on the back of the pins. In order to weld material, they must have the same origin, in this case brass.

When the cufflink finish or relief, requires different material like zamac, the cufflink attachment will not be welded, but glued on the back of the pins parts. This will result a high percentage of cufflink with falling of cufflink attachment most of the time.
